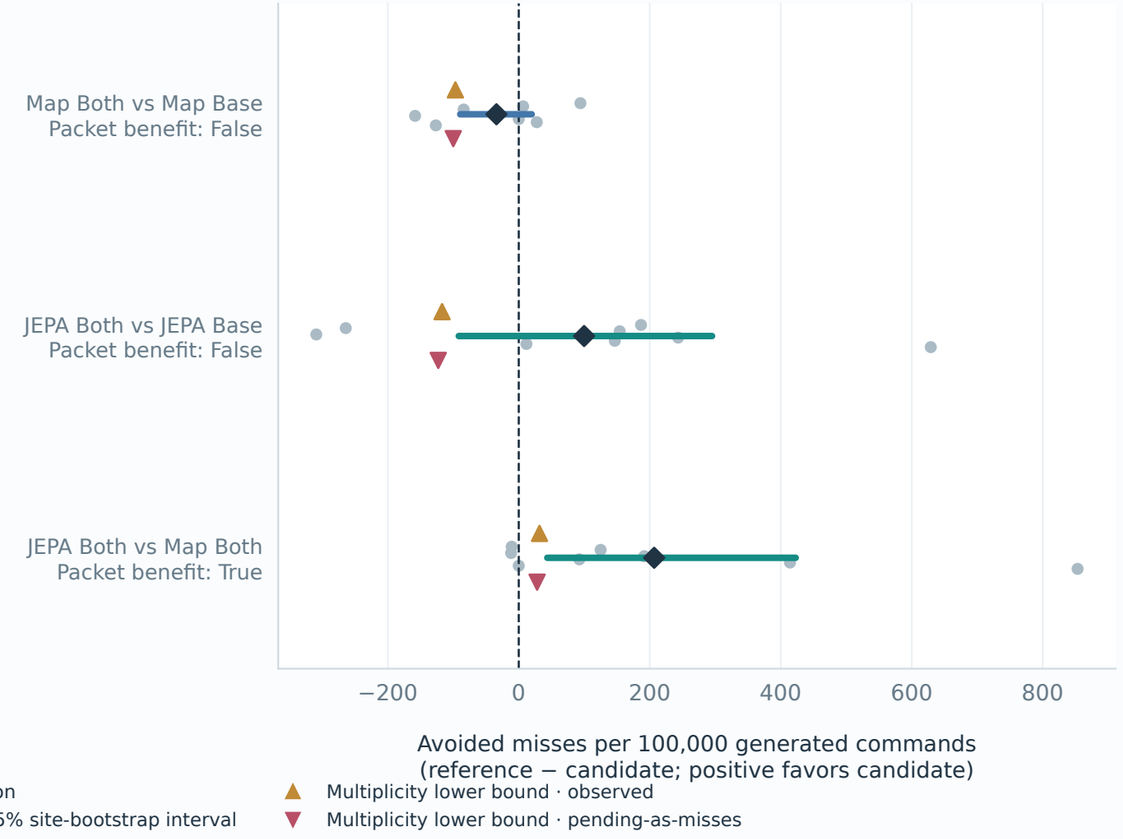
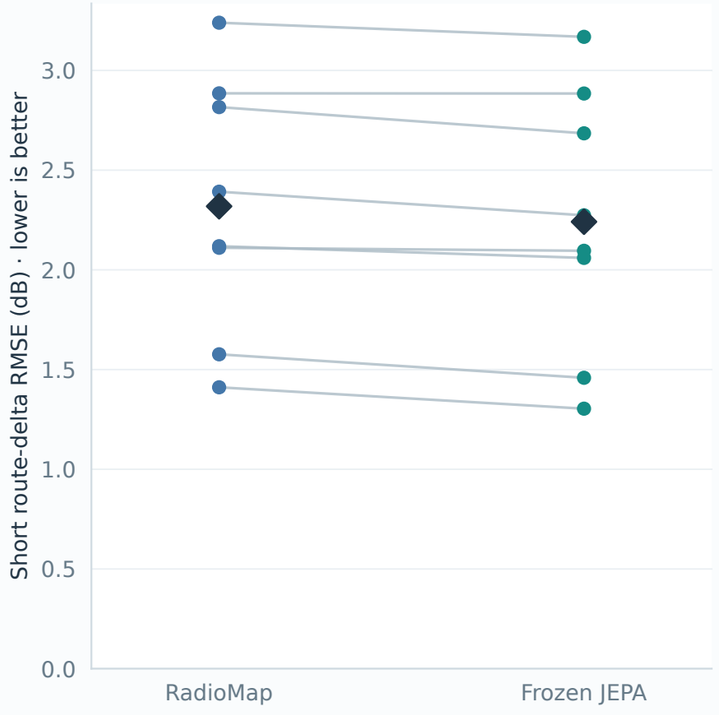
Packet benefit and forecast accuracy answer separate questions

Four prespecified primary slots · whole-site pairing · observed and conservative endpoint bounds

A Registered packet contrasts



B Matched route-change prediction



Mean Map − JEPA: +0.078 dB
Multiplicity lower bound: +0.039 dB
Matched accuracy flag: True

All four primary slots retain 1 − 0.05/4 bounds. Packet benefit also requires unchanged tail, silence, video and bulk engineering gates.
Matched RF uses identical public histories/queries, horizons 1–5 s, and no additional sites. Forecast accuracy alone does not qualify a controller.
Source / causal / paid / exact replay integrity: True. Simulation evidence; fixed neural weights, no hardware or production qualification.
